

Quartz and alumina are the main constituents of our hydron pellets and clay balls. The material is inert under the prevailing chemical conditions and is not subject to chemical changes over time. In particular, it has no negative influence on water quality.

For special seals in civil engineering, road and sewer construction, pile foundations, dam and slope stabilisation etc., the VFF sealing materials are available in the form of discs, cubes or strands with a wide range of sections with high-vacuum viscoplastic consistency or as powdered clay.

The VFF team will be happy to advise you and find the right product for your application.
