

As the largest manufacturer of inert balls and tower packings in Europe and on the basis of decades of successful cooperation with noted colleges and universities, we feel we have a duty to contribute to education about the subject of tower packings and column internals. VFF has therefore produced the Uni Pack which we will be happy to send to universities on request. The VFF Uni Pack consists of:

- A full version of the VFF tower packing software with no user restrictions
- A poster illustrating the internal workings of a column
- A sample case\* of the most important tower packings
- and a demister (mist eliminator) pad.

Students can also receive the student version of the VFF tower packing software free of charge on production of their student card (value: 300 euros, plus V.A.T.).

For further details please visit our downloads page.

You can download the software immediately and upload your student status details

for software validation. Please note that the software must be validated before use.

Validation is based on verification of student status details and is completed within 3 working days.
